Results obtained optimising the J_{MVIB-T} objective. Experiments are executed five time with random independent training-test splits. Values in brackets refer to the standard error over the repeated experiments. All values in the table refer to metrics computed on the test sets. auROC: area under the under the receiver operating characteristic curve. AC: classification accuracy. F1: F1 score. P: precision. R: recall. D, F.1, F.8 and J refer to the four pre-processing techniques adopted and the four collections of datasets obtained: default (D), joint (J), filtered.1 (F.1), filtered.8 (F.8).

^{*:} For these datasets, the F.1 or F.8 filtrations did not preserve any markers and experiments could not be preformed.
